

Even with the most comprehensive maintenance program, all elevator systems will eventually need to be modernized or replaced.

With careful planning, modernizing your elevator can be a strategic capital investment in which you can take advantage of the opportunity to reduce operating expenses to obtain incentives.

In many areas of New York, utility companies and the state provide incentives for equipment and process improvements that generate energy savings. Most of these programs offer bonuses for elevator controls and cash incentives for energy efficiency upgrades.

We carry out a thorough assessment of your equipment and provide clear recommendations on available rebates or incentives for elevator modernization projects to minimize your annual budget.

ELEVATING YOUR INCENTIVES

As an experienced energy consultant DVM Industries works with you to determine the current energy usage of your elevator system, as well as the efficiency and power quality of your elevators.

After a thorough review of your system DVM Industries will work with you to apply for energy rebates and incentives from utility companies and government agencies. We determine the amount of incentives that should be awarded based on the technology used in the elevator system upgrade and offer verification services to ensure program compliance.

What is DVM's role?

- We complete the lengthy application process for the various funding options (NYSERDA, ConEdison and other utilities) on your behalf.
- We certify the baseline conditions and project energy savings for approval of the utility.
- We conduct the necessary pre and post inspections.
- We provide measurement and verification of the energy savings for the project.
